PROFILE

I have been building personal digital projects since early 2025 with Codex, Claude Code, Cursor and ChatGPT. I define requirements, break work into tasks, choose interfaces and check user scenarios with AI. AI tools produce a substantial part of the code. I have no commercial IT or IT-team experience yet. I am seeking paid junior tasks with technical review and learning opportunities.

PERSONAL PROJECT WORK

Since early 2025. Personal projects and test assignments, not employment.

Vedomost

A payment-record demo for a learning centre: students, partial payments and monthly debt. Add a student, record a payment and inspect the remaining balance. A test assignment with fictional data; no real money transfers.
My contribution: requirements, interface choices and scenario checks with AI; substantial implementation by AI tools.
https://dobropalm.tech/demos/vedomost/
https://github.com/kevinscott66/vedomost

Sloyra

An illustration composer using existing SVG objects: selection, arrangement, resizing and vector export. Matching uses a local dictionary and rules, not an LLM. A test assignment; supplied artwork has separate usage terms.
My contribution: requirements, interface choices and scenario checks with AI; substantial implementation by AI tools.
https://dobropalm.tech/demos/svg-studio/
https://github.com/kevinscott66/sloyra

dobropalm Agent

A personal multi-agent platform for project context, task queues and owner-approved actions. Telegram is one interface. The isolated website demo uses illustrative data and does not run remote models.
My contribution: requirements, interface choices and scenario checks with AI; substantial implementation by AI tools.

https://github.com/kevinscott66/ai-agents

OTHER PERSONAL PROJECTS

VahtaHoz: A personal inventory and task application for rotational crews: stock receipt and issue, roles and an operation log. Personal project work; no commercial deployment or measured time savings claimed.
KOM17: A personal Telegram community platform with moderation, invitations and an internal economy. I work on product rules and scenario checks with AI. Public demonstration records are not usage metrics.
AirChat: A personal messenger without phone numbers, with portable identity and client-side encryption. My focus is account and recovery scenarios with AI. No independently audited security or personal cryptography expertise claimed.
Viora: A personal-library audio player with audio import, favourites and playback queues. Built with Flutter/Dart. Portfolio captures use fictional tracks in a demo build; no App Store availability claimed.
DeLabs: A personal channel and information site about crypto activities, with project references, sources and guides. This is not commercial development experience or evidence of investment returns.

APPROACH AND TOOLS

Requirements, task breakdown, interface review, bug reproduction and result checks with AI. Project technologies include JavaScript/TypeScript, Python/FastAPI, SQL and APIs. These describe implementation stacks, not independent professional mastery.

EDUCATION AND LANGUAGES

Basic general education: 9 school grades, School No. 18, Magadan. Self-taught through personal projects; no specialist training courses. Russian native. English A2, self-assessed; translation tools for complex documentation.

NON-IT EXPERIENCE

T-Bank, overdue debt customer operator, March-May 2022. Customer communication about payments. This is not software development experience.

WORK PREFERENCES

Remote from Russia; European daytime preferred. Scope, compensation, schedule and start date subject to discussion.
