ABOUT ME

From idea to working version

I take products from an idea to a working version: define the problem, design the architecture and verify the result.

I use AI tools in development.

I have worked in crypto and run a channel about activities since 2022. I started working with AI in 2023.

PROJECT

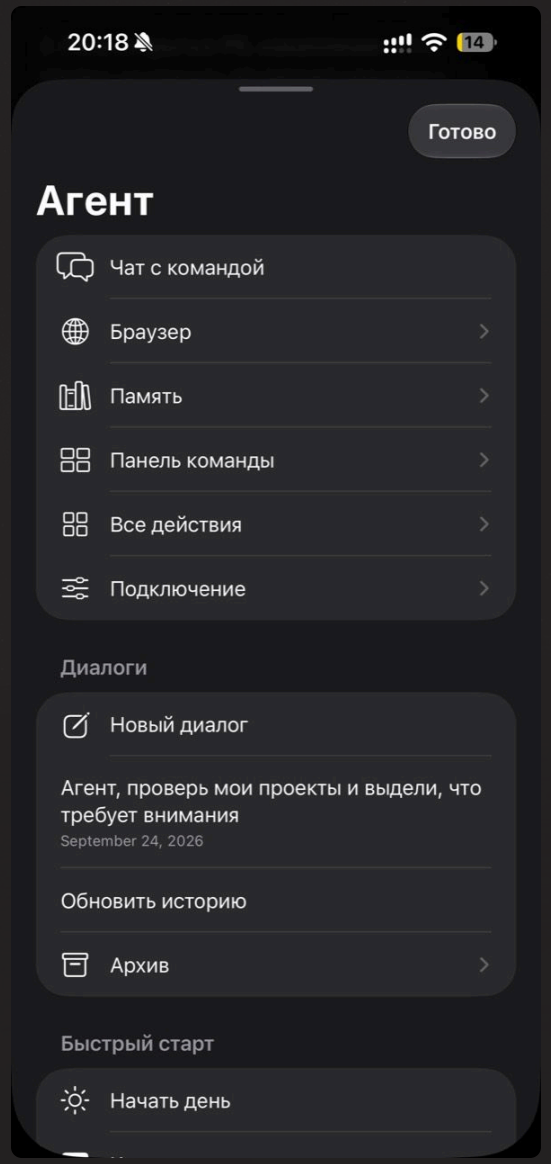

DOBROPALM Agent

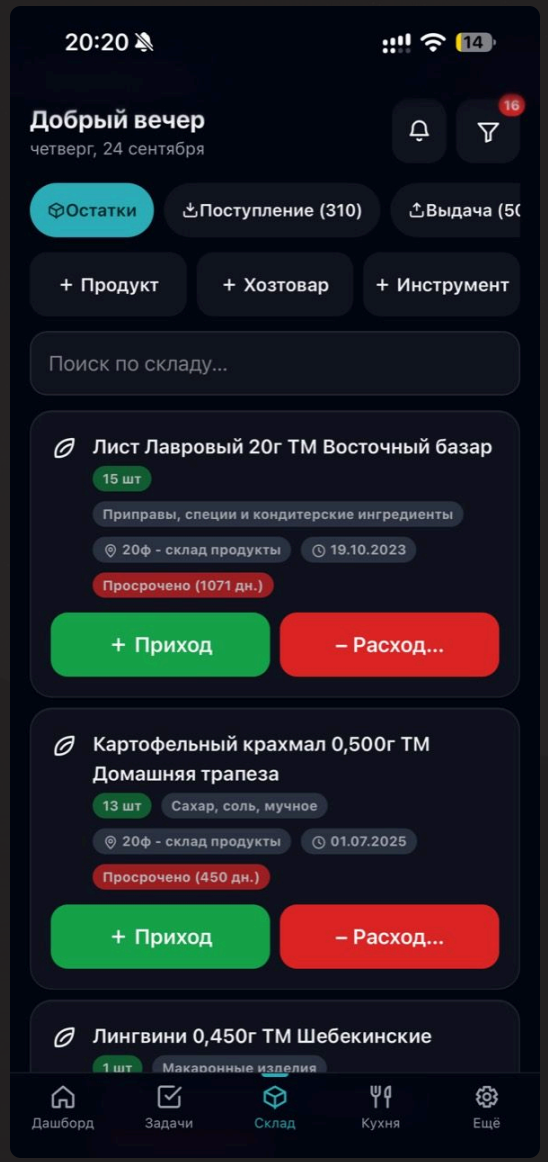

I am building an assistant that lets me continue the same conversation in Telegram, a browser and on an iPhone.

It shares conversation history, supports voice and keeps memory linked to the original messages. I approve actions that require confirmation.

I am developing its virtual office and MCP integrations.

View on GitHub

PROJECT

VahtaHoz

I built an inventory and task application for field teams.

Stock receipts, issues, expiry dates and an operations log are kept in one place. Local features work with an unreliable connection.

Stack: PWA and Supabase.

PROJECT

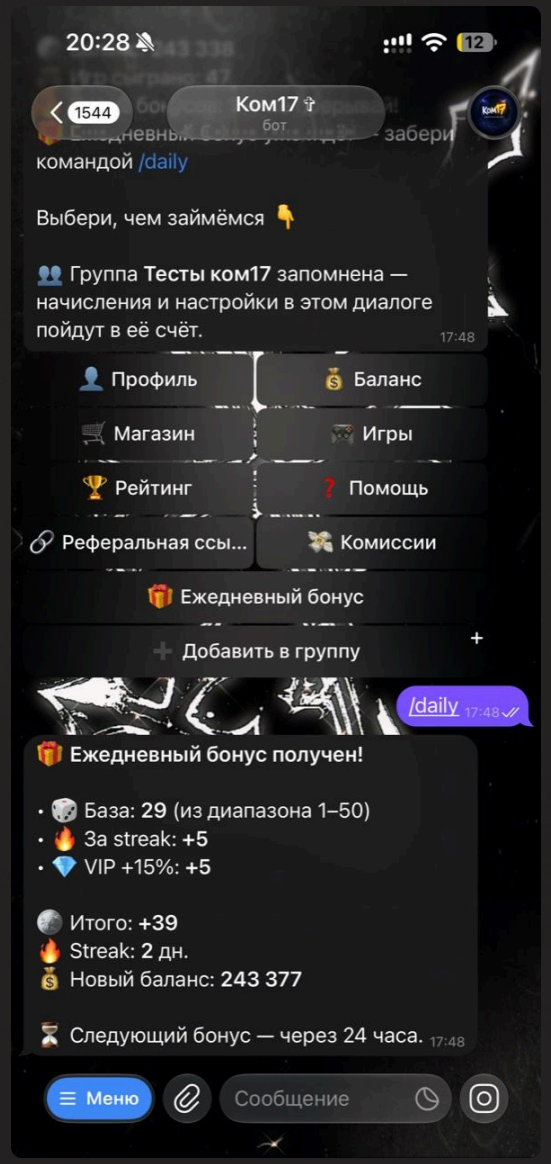

KOM17

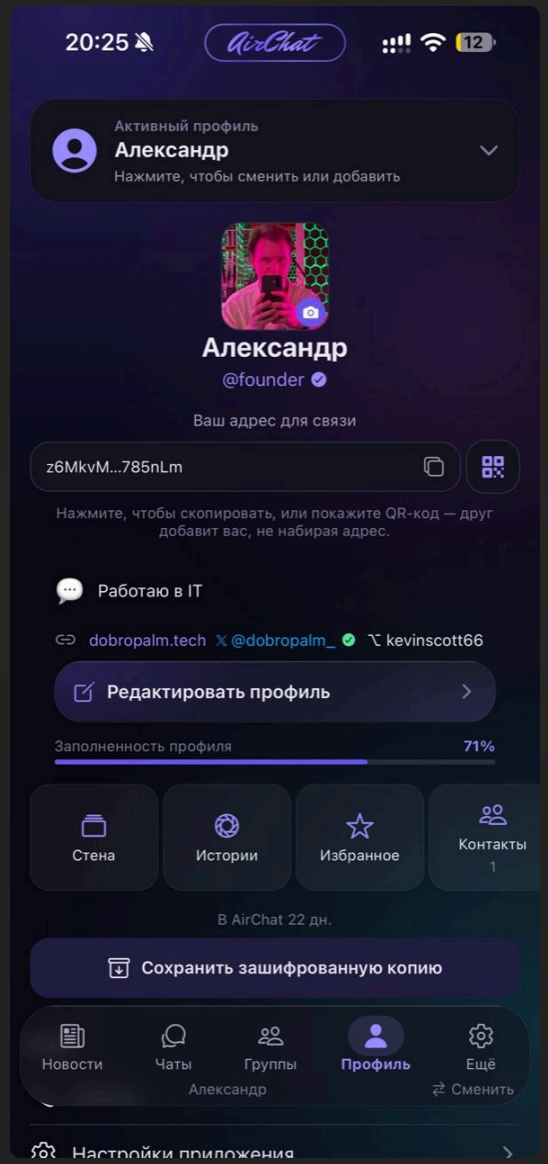

My Telegram community bot handles invitations, moderation, an internal economy and daily rewards.

I started with a monolith, then split it into modules and moved to FastAPI and aiogram 3.

I published the source on GitHub.

PROJECT

AirChat

I am developing a messenger with accounts that do not require a phone number.

A seed phrase defines the identity. History is encrypted on the client before it reaches the server.

I use React Native and Expo. The web client is available, and I continue to develop the app.

View on GitHub

PROJECT

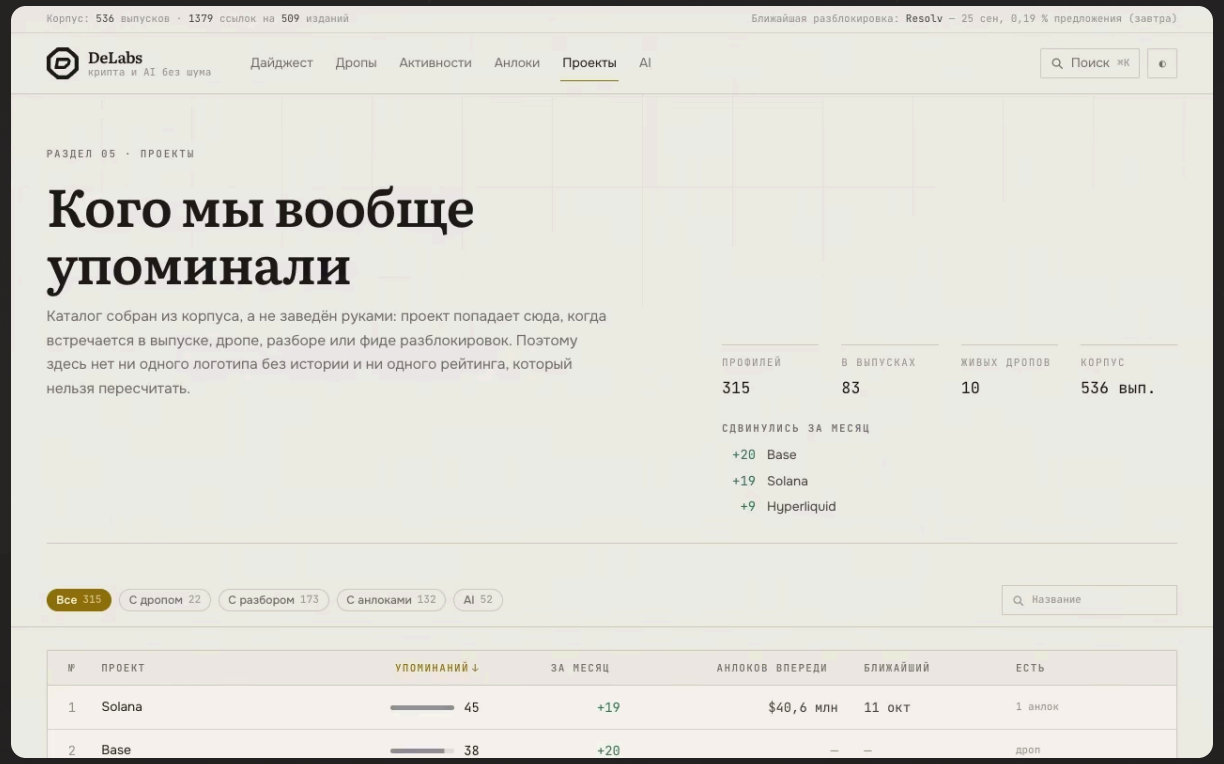

DeLabs

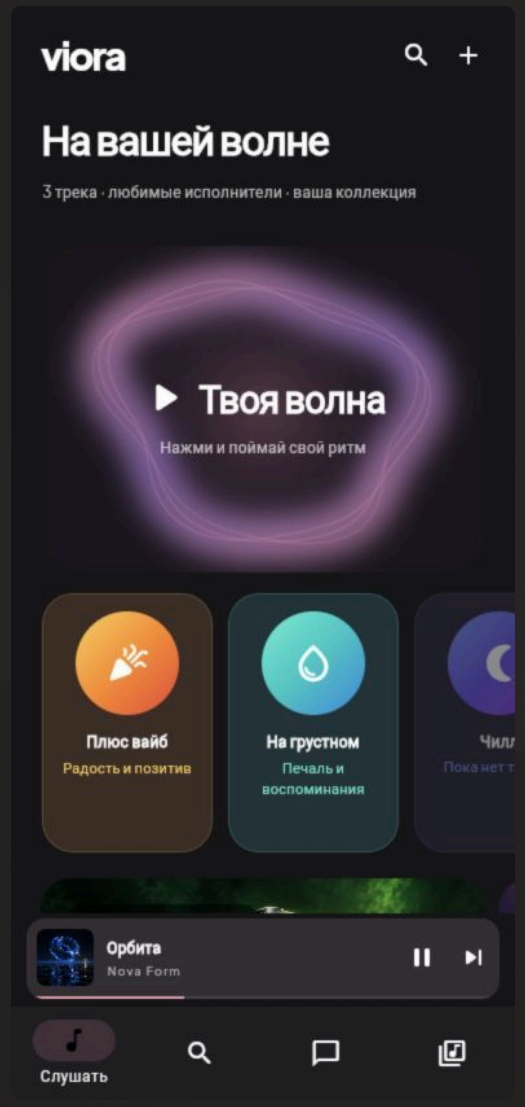

My project for researching crypto projects and activities.

The catalogue and search connect projects to sources and instructions.

Built with Next.js, React and TypeScript.

Demo home screen with fictional tracks

PROJECT

Viora

I am building a music application for a personal library.

File import, favourites, queues and background playback. I am adding mood selections and saved favourite fragments.

I develop it with Flutter and Dart. The source is published on GitHub.

How I work

1

Understand

I understand the current process and define the desired result.

2

Agree

Before development, I agree on the scope and completion criteria.

3

Deliver

I show a working version and test the user scenario.

4

Hand over

I hand over the result with instructions and discuss ongoing support.

COLLABORATION

Let's build something together

I take on automation, AI assistant, Telegram bot and application projects.

I am looking for a developer to grow my own products with.

I am also open to joining a company.

Let's discuss your project
